

Covid-19 Risk Assessment Chart

1. Do you live in the same house as the case?
2. Are you their intimate partner?
3. Have you provided any care to the patient while he/she was sick?

If no to all...

If yes to one or more...

Were you in the same indoor environment like a classroom with the patient for 15 minutes or more during his/her infection period?

1. While the patient has been ill, has he/she been spending most time in a different room from you?
2. When you are in the same room and in all your interactions, are you using a face mask and gloves?

If yes or unknown...

If no...

1. Were you within six feet of the patient for 15 minutes or more?
2. Has the patient coughed or sneezed on you since 48 hours before they fell ill?

No Identifiable Risk

If yes to both...

If no to at least one...

Medium Risk

High Risk

Do you have a fever, cough, or shortness of breath?

If yes...

If no...

Isolate yourself until at least 7 days have passed since symptom onset and 72 hours since fever resolved and respiratory symptoms improved. Seek testing if possible.

Quarantine for 14 days since your last exposure to the patient. Stay home as much as possible and 6 feet from others when you must go out. Watch for any symptoms.

If a contact receives a positive test result, restart the tracing process, tracing the new case's contacts.

If symptoms arise, isolate immediately.
